

***Chaus V.S.* Regulation of the National Economy under Russian Terrorism against Ukraine**

Annotation

A modern model of state regulation of the national economy is analysed. Its characteristics in the current extreme conditions are defined. Some ways and measures for forming a new model of economic policy that will provide high and stable rates of economic development are suggested. The experience of adjusting economy of foreign countries, which provides a good combination of high-level rational state intervention tactics deregulation, is described. Some measures of national economic regulation aimed at stabilizing the situation of military and economic security in terms of Russian aggression are substantiated.

Keywords: regulation of economy, economic dictatorship, deregulation, macroeconomic stabilization, economic security, aggression, terrorism.

Summary

In the current extreme conditions Ukrainian authorities have to defend the country, its achievements from the encroachments of other States or of any unforeseen circumstances. Also the history of Ukraine should be cleared from occupying enemy lies. Under these conditions, particularly relevant is the need for the formulation and implementation of anti-crisis economic policies, institutional support and development of new approaches to the state regulation of the national economy.

The aim of the study is to assess the current model of state regulation of the economy and the development of measures that will ensure the stabilization of the situation, military and economic security of the state in terms of economic and political crisis, against the backdrop of economic, political and military confrontation with Russia.

The issues to be addressed include: how to ensure under conditions effective war of regulation, save departmental and state monopolies, guaranteeing economic democracy, avoiding bureaucracy, corruption in the state apparatus, deformation and changes in the existing legislation in case of the decision-making at the macro level. How to ensure freedom of competition, initiative and enterprise, a strong motivation to work, investment and innovation, not allowing voluntarism, excessive fiscal press and growing public debt.

The realities put new demands on government regulation, it should provide a flexible, stable and reliable governance process and receive the scheduled qualitative strategic and current practical results quickly respond to changing internal and external environment and achieve maximum state control. It should be reasonable to organize the state control unit, which includes: technology; methods of achieving goals; art management. The control unit allows optimal connection into one indivisible whole: human, material and financial resources; natural, economic and industrial potential; needs and interests of citizens of the capabilities of the state in war.

Support these extremely complex processes in a state of dynamic equilibrium, harmoniously combining the power of all the people of personal responsibility of every government official should be based on the active development of funda-

mental science with governance. In time of war Ukraine needs to develop a doctrine of absolute state of democracy building up the economic dictatorship.

Economic dictatorship in a short time is able to overcome the negative phenomena and processes in the economic life of the state, which emerged and strengthened during the formation of market relations, corruption, tax evasion, barter and shadow economy, major abuses in the sphere of external relations in the energy market in production and sales of excisable goods.

So, the role of state regulation of economic processes in the transition period to a market economy should be much more significant than in the developed market economy. This role is enhanced under conditions of military aggression. For macroeconomic stabilization state policy should be directed at ensuring economic growth, improving product competitiveness, stimulating efficiency of enterprises, the creation of free corporate capitalism economy by capitalization legally received income, return of illegally exported public funds, nationalization of property of former officials refugees.
